No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

The present invention relates to an isolated nucleic acid molecule encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related nucleic acid sequence. The present sequence is published separately from the main body of the specification as EPO data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cell proliferation related polypeptide; cell proliferation; senescence; differentiation; stress response; ds.

                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes a E2F-dimerisation partner (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding shape, and particularly to alter cell proliferation characteristic such as to alter plant cell, organ or tissue so to alter plant cell, organ or tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100

Claim 1; SEQ ID NO 1549; 510pp; English.

decreased anthocyanin levels. Note: The sequence data for this patent did The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to osmotic stress, increased tolerance to cold, increased germination in cold, increased tolerance to heat, increased germination in heat, increased tolerance to freezing conditions, increased tolerance to low nitrogen conditions, increased tolerance to low phosphate conditions, increased tolerance to seed, increased leaf wax, increased leaf fatty acids, altered seed oil content, altered seed brotein content, altered seedprenyl content, altered leaf prenyl lipid content, increased anthocyanin levels, and not form part of the printed specification, but was obtained in ftp.wipo.int/pub/published\_pct\_sequences. format directly from WIPO at

tungal disease and particularly Erysphe, Fusarium and Botrytis, chugal disease and particularly Erysphe, Fusarium and Botrytis, concreased tolerance to multiple fungal pathogens, increased resistance to increased sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, increased sensitivity to ABA, concreased sensitivity to ABA, reduced sensitivity to ABA, and a sensing, increased tolerance to sugars, altered furbour structure, loss of flower increased tolerance of fertility, altered furbone meristem development, altered branching pattern, altered trichome density, altered branching pattern, altered trichome development, altered branching pattern, altered trichome structure, altered richome development, altered shade avoidance, altered seed development, altered shade avoidance, altered seed development, altered shade development, altered shade concreased altered seed coloration, altered cell proliferation, altered cell proliferation, altered cell expansion, altered phase change, altered senescence, abnormal embryo development, altered programmed cell catch, lethality when overexpressed, altered necrosis patterns, increased coll proliferation, altered seed solarity, altered seed coloration, altered seed shape, large seedlings, dwarfed plants, dark green or gray leaves, also grown altered seed solarity, altered seed coloration, altered seed shape, large content, altered seed coloration, altered seed shape, large content, altered seed bazial/daxial polarity, altered seed coloration, altered seed shape, large content, altered seed brings and content, altered seed shape, large content, altered seed shape, large seed increased anthocyanin levels, and content, altered seed coloration, altered seed seed coloration, altered seed shape, large content, altered seed shape, large content, altered seed coloration seed seed coloration of the printed seed seed coloration seed seed coloration of the property altered seed coloration seed seed coloration increased anthocyanin levels,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel plant transcription factor proteins (1) and nucleotide sequences (11) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises in altered trait selected from increased tolerance to ablotic stress, increased tolerance to object stress, increased germination in cold, increased tolerance to cheat, increased increased tolerance to lear, increased committed to learned to the cold, increased tolerance to lear, increased increased tolerance to low nitrogen conditions, increased tolerance to low nitrogen conditions, increased tolerance to low phosphate conditions, increased tolerance to low phosphate conditions, increased tolerance to
                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                              Reuber TL;
                                                                                                                                                                                                                                                              Adam LJ, Ra

The present invention relates to novel plant transcription factor

proteins (I) and nucleotide sequences (II) (Ab061534-Ab063778). The

sequences can be used to produce transgenic plants, which overexpress

(II), where the transgenic plant has an altered trait as compared to a

contransgenic plant or wild-type plant. The transgenic plant comprises

con altered trait selected from increased tolerance to abiotic stress,

increased germination in cold, increased tolerance to heat, increased

confirmation in heat, increased tolerance to heat, increased

confirmation in heat, increased tolerance to disease, including

confirmation in heat, increased tolerance to disease, including

confirmation in heat, increased tolerance to disease, including

confirmation in heat, increased tolerance to disease, including

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ठे
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel plant transcription factor proteins (1) and mucleotide sequences (11) (AD061534-AD065778). The sequences can be used to produce transgenic plants, which overexpress (CI), where the transgenic plant has an altered trait as compared to a non-transgenic plant for wild-type plant. The transgenic plant comprises constructed from increased tolerance to abidic stress, increased tolerance to cold, increased tolerance to heat, increased colerance to conditions, increased tolerance to heat, increased colerance to low introgen conditions, increased tolerance to disease, increased tolerance to cold, increased tolerance to disease, increased tolerance to cold increased tolerance to low mitrogen conditions, increased tolerance to whosphate conditions, increased tolerance to disease, including thugal disease and particularly Erysiphe, Fusarium and Botrytis, increased sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, colorance to sugars, altered carbon/nitrogen sensing, early flowering, latered track flower structure, loss of flower determinacy, reduced fertility, altered shoot meristem development, altered branching pattern, altered steem morphology, altered vascular tissue structure, reduced colorance, altered seed development, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll development, altered phase change altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an isolated nucleic acid molecule encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, sensecence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related nucleic acid sequence. The present sequence is published separately from the main body

New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.

Claim 38; Page 185-186; 316pp; English.

The invention relates to a novel cell cycle protein (CCP) and the polympotic and which binds to the which modulates the activity of the polympotide and which binds to the polympotide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell cycle or growth of a plant such as Abaldopsis thalians, rice, wheat, cycle or growth of a plant such as Abaldopsis thalians, rice, wheat, cycle or growth of a plant such as Abaldopsis thalians, rice, wheat, compared to a plant such a research cand canola. CC maize, tomato, alfalfa, oilseed rape, soybean, sumflower and canola. CC conclet cacid and polypeptide molecules are useful as modulating agents in plants. CCP is useful to treat a trivity. Compounds that bind to or modulate the activity of CCP protein or production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP polymucleotide is useful for modifying cell fate, plant development, polympotides are useful as herbicides or plant growth regulators. The polymucleotide is useful for modifying cell fate, plant development, in coll cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, seed set, plant morphology, biochemistry and/or physiology, the length of the coll cycle of and the anti-CCP antibone, where the protein involved in the cell cycle due to and the anti-CCP antibons, including abiotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as cold, continion, heat, drought, salt stress, or biotic stress such as cold, activity of a part of the protein involved in the cell cycle detect plant architecture, plant quality traits, plant reproduction and seed development, endocreduplication in storage cells, storage crissons and/or generate antibodies. CCP protein is useful so an immunogen to generate antibodies. CCP protein is useful feels on modulate collection or modulate is useful set and to m nvention

New nucleic acid molecule encoding a cell proliferation-related polypeptide, useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops.

Claim 3; SEQ ID NO 13; 408pp; English.

The present invention relates to an isolated nucleic acid molecule encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for acid modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related nucleic acid sequence. The present sequence is published separately from the main body of the specification as EPO data.

Reuber TL;

Adam LJ, R

Creelman RA, Keddie JS,

Dubell AN,

The present invention relates to novel plant transcription factor

CC proteins (1) and nucleotide sequences (11) (ADO6154-ADO63778). The

sequences can be used to produce transgenic plants, which overexpress

(11), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises

(11), where the transgenic plant has an altered trait as compared to an altered trait selected from increased tolerance to abortic stress, increased tolerance to cold, increased tolerance to cold; increased tolerance to conditions, increased tolerance to freezing conditions, increased tolerance to disease, including to phosphate conditions, increased tolerance to disease, including to increased tolerance to multiple fungal pathogens, increased tolerance to glyphosate, increased sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABC, altered sugar sensing, increased tolerance to sugars, increased tolerance to sugars, altered sensitivity to ABC, altered sugar sensing, increased tolerance to sugars, altered subor, mittogen sensing, early flowering, latered subor, altered subor, altered wascular tissue sensing, altered subor, altered subor, altered wascular tissue structure, altered subor, altered vacular tissue structure, altered density, altered trichome structure, altered vacular tissue structure, altered seed development, altered bands and altered cell proliferation, altered cell expension, altered cell proliferation, altered cell expension, altered density, altered cell proliferation, altered density, altered cell proliferation, altered seed intered seed sensectence, abnormal embryo altered seed richome structure, altered development, altered cell proliferation, altered seed sensition, altered seed sensectence, abnormal embryo altered seed prolaming, altered seed sensected cell proliferation, altered seed sensition, altered seed sensected and seed coloration, altered seed seed selection content, altered seed seed coloration, altered seed seed o electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

```
The present sequence encodes a corn DP (not defined) polypeptide. The polypeptide is a transcription factor that activates transcription of numerous genes involved in DNA replication, thus playing a role in the G1 to 8 transition in the cell cycle. Do, also called Driff (differentiation regulated transcription factor 1) has been shown to form specific multiprotein complexes with the retinoblastoma susceptibility protein, plo7, cyclins and cdk2. The DP polynuclectide was used to produce a transgenic plant. The DP nucleic and proteins are useful for increasing transformation efficiency in plants by increasing the number of dividing cells in the plant (dividing cells may be more receptive to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         35

The invention relates to a novel cell cycle protein (CCP) and the polymucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the collypeptide and which binds to the polypeptide and which binds to the collypeptide and an anti-CCP antibody is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, aliase, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP nucleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein or production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP protein or production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP polymucleotide is useful for modifying cell fate, plant development, plant morphology, biochemistry and/or physiology, the length of the Cl, c, G2 and/or M phase of the cell cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, seed set, csed development, tuber, fruit, leaf formation, shoot and root initiation and/or development, nodule function, dwarfism in plants, sender and the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle deprivation, heat, drought, salt stress, cor biotic stress such as cold, nutrient convirtuned are minimucled to medulate e.g. enhance crop yields, and attenuate convirtunely plant quality traits, plant reproadcution and seed cells to path and and plants or its parts. CCP is useful as an immunogen concerned antibodies. CCP protein is useful as an immunogen or convirture of protein is useful as useful as an immunogen proper protein plant grants. The polymunication is useful as useful as an im
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       499

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   occurring CCP substrates. The polynucleotide is useful for expressi protein, to detect CCP mRNA, or a genetic lesion in a CCP gene and modulate CCP activity. The present sequence encodes a CCP protein o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1442 BP; 451 A; 321 C; 297 G; 373 T; 0 U; 0 Other;

This is the nucleotide sequence of a contig assembled from the CDNA inserts in clones p0005.Cbmfh2zr, cdelc.pk001.j13 and cen3n.pk0183.bi. It encodes a portion (see AAY32164) of a corn protein that shows homology to human cell cycle regulatory protein DP-2. The deduced amino acid sequence of this cDNA represents 50% of the middle region of the DP-2 protein. The coff constructed from cDNA libraries constructed from corn constructed from corn construction. The invention relates to nucleic acid fragments (see AAZ34575-83) encoding plant CDC-16, DP-1, DP-2 and E2F cell cycle regulatory protein, see AAZ3159-67). It also relates to the cell cycle regulatory protein, in sense or antisense orientation, where construction of a chimeric gene encoding all or a portion of the chimeric gene results in producton of altered levels of the cell cycle regulatory protein, in sense or antisense orientation, where cycle regulatory protein in a transformed host cell. The nucleic cycle regulation in plants, provide genetic tools to enhance cell growth in cycle regulation in plants, provide genetic tools to enhance cell growth in the proteins may be used to facilitate studies of call cycle more stable cransformations. The proteins may also provide targets to facilitate constructions that may a be useful as herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |||| ::|||||||:::::--ACTAGTATAAGGTGATATGAGATTGAAGACTGAGCTTGTGGGACTGAAA 443

plant morphology, biochemistry and/or physiology, the length of the G1, S G2 and/or M phase of the cell cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, seed set, seed development, tuber, fruit, leaf formation, shoot and root initiation and/or development, nodule function, dwarfism in plants, senescence, tolerance or resistence to stress. CCP, the polymucleotide and the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due to environmental conditions, including abiotic stress such as cold, mutrient deprivation, heat, drought, salt stress, or biotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as carefuled development, endoreduplication in storage cells, storage tissues and/or storage organs of plants or its parts. CCP is useful as an immunogen to generate antibodies. CCP protein is useful to screen for naturally occurring CCP substrates. The polymuclesion in a CCP gene and to modulate CCP activity. The present sequence encodes a CCP protein of the

CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and which binds to the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP nucleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP polypeptide are useful for modifying cell fate, plant development, New cell cycle protein and nucleic acid molecule encoding it useful fregulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.

/lone lib="Hordeum vulgare pre-anthesis spike EST library //lone lib="Hordeum vulgare pre-anthesis spike EST library HVcDNAÖ008 (white to yellow anther)"
//note="Vector: lambdaZAPP: Site= 1: ECOR1; Site 2: XhO1; Plants were grown in the greenhouse at the University of California, Riverside (Fenton, SJ Close, TJ Close). Whole spike with awns trimmed were collected at white, green and yellow anther stages (Fenton). Total RNA was prepared from each pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified CDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids These steps were performed in the TJ Close lab (Choi) at the University of California, Riverside. Phagemids were plated and picked at the Clemson University Genomics Institute (UCI) (Begum, Panher, Frisch, Atkins and Wing) Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see hitr://www.genome.

/note="Organ: Apical meristem and tissues surrounding of mature plants; Vector: pSport1; Site_1: Sal1; Site_2: Mot1; An unidirectional cDNA library generated from Rapical meristem and tissues surrounding of mature plants]. cDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"

(10cm-long); Vector: pSport1; Site 1: Sal1; Site 2: Not1;
An unidirectional CDNA library generated from [Developing inflorescence and rachis (10cm-long)]. CDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Jetuseverge.

Direct Submission

Submitted (18-NOV-2003) Genoscope - Centre National de Sequencage :

BP 191 91006 ENRY cedex - FRANCE (E-mail : segref@genoscope.cns.fr
- Web : www.genoscope.cns.fr)

The sequences are based on single pass reads.

Life Technologies (a division of Invitrogen) members carried out full-length librairies construction : Temple G.

Genoscope members carried out sequencing and annotation : Castelli V., Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C., Schachrer V., Weissenbach J., Salanoubat M.

WRGV INRA : Clepet C., Caboche M.

Annotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences) : 5 prime and 3 frime are assembled with Phrap.
                                                                                                                                                                                                                                                                                                                                                                                   Arabidopsis thaliana Full-length cDNA Complete sequence from clone GSLTLGS7ZA12 of Adult vegetative tissue of strain col-0 of Arabidopsis thaliana (thale cress).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (bases 1 to 1403)

Submitted (25-APR.2002) Maize Mapping Project, University of Missouri, Columbia, MO 65211, USA
If you are interested in getting corresponding physical clones, these are publicly available from ZmDB and may be found by BLAST searching at MSL, maizemap.org; ZmDB, www.zmdb.iastate.edu; TIGR, www.itgr.org; or NCBI, www.ncbi.nlm.nih.gov. When the source of the maize cDNA sequences is either Virginia Walbot, Stanford or Pat Schnable, Iowa State, then clones may be requested from ZmDB:
www.zmdb.iastate.edu.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HTC 16-OCT-2002

//Lab host="Vector: pCWNSport6.1; Site=1: BCSRI; Site=2: Not1;
supplier: Solanum tuberosum var. Kennebec plants were
grown from cuttings on a 16hr light/8 hr dark cycle at 25
C for 3-4 weeks. Abiotic stress conditions were applied to
four separate sets of plants. Set 1 involved saturation of
the soil with 150 mm Nacl and tissues were harvested at
following application of the salt stress (leaves: 2hr,
6hr, 12hr, dd, 2d, and 4d; roots:2hr, 6hr, 12hr, and 2d).
Set 2 were grown under the standard conditions and then
were water stressed by withdrawal of further watering
applications. Drought: stressed plants were harvested after
cessation of watering (leaves: 3d, 5d, and 7d; roots:3d
and 5d). Set 3 were grown under the standard conditions
and then were cold stressed by placement at 4 C. Cold
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and heat-stressed roots were harvested at 6 hr,
12 hr, 1 d, and 4d. RNA was isolated from all tissues and
equal RNA from each tissue and stress was pooled to
construct the cDNA library. RNA sample."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 7,
